## Main Software Development Activities

### Requirements Gathering

Define requirement  
specification

### Analysis

Define the conceptual  
model

### Design

Design the solution /  
software plan

### Implementation

Code the system based on  
the design

### Integration and Test

Prove that the system meets  
the requirements

### Deployment

Installation and training

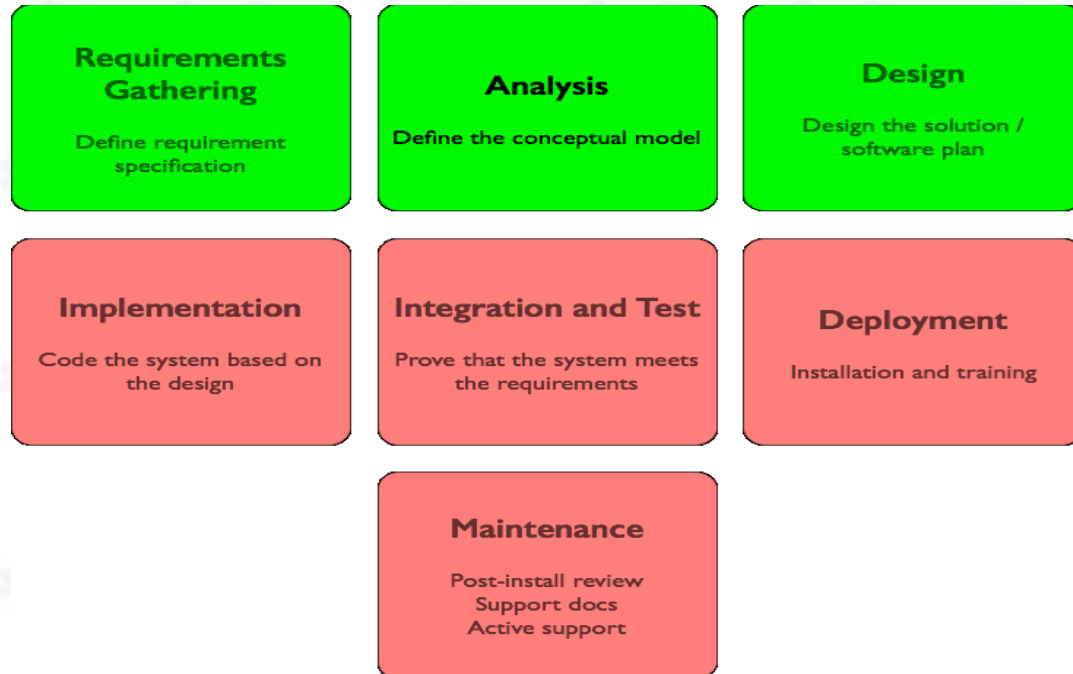

### Maintenance

Post-install review  
Support docs  
Active support

## Object-Oriented Analysis and Design

- **Analysis** emphasizes an investigation of the problem and requirements, rather than a solution.
- During **object-oriented analysis**, there is an emphasis on finding and describing object or concepts in the problem domain.

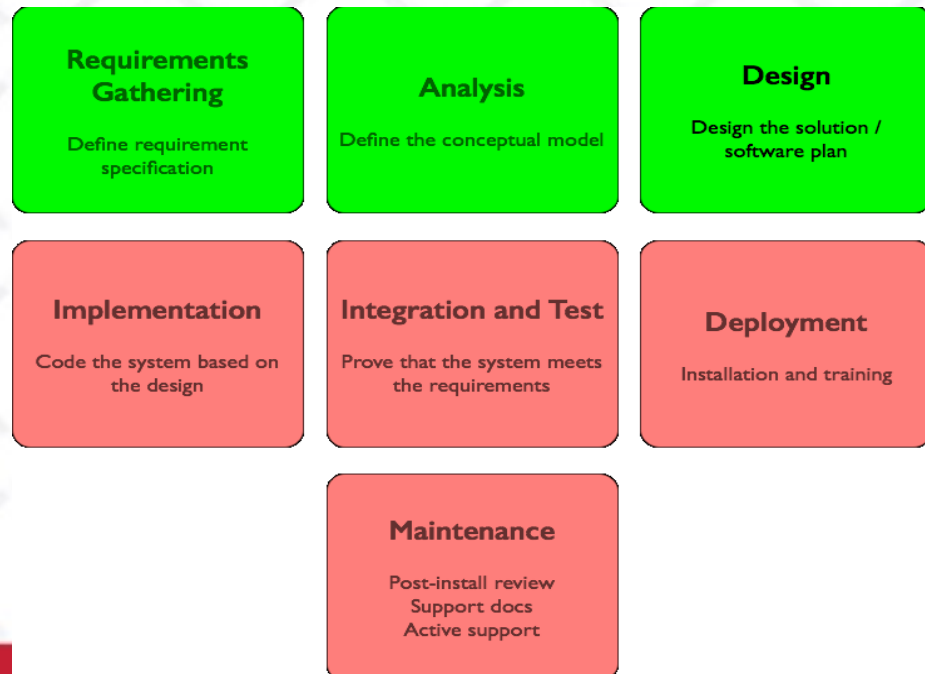

If a **cash register system** at the supermarket is desired  
How will it be used?  
What are its functions?

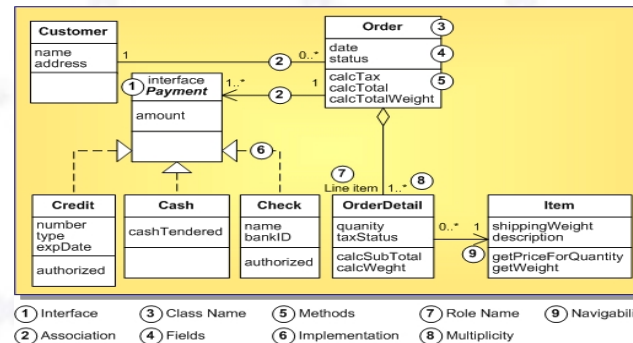

# Object-Oriented Analysis and Design

**Design** emphasizes a conceptual solution in software that fulfils the requirements and “guides” the implementation.

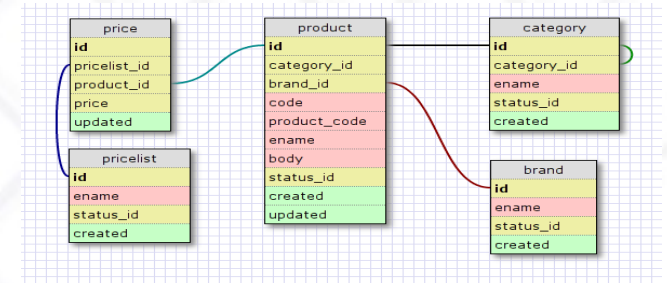

During **object-oriented design**, there is an emphasis on defining software objects and how they collaborate to fulfil the requirements.

# Software development process

**Software development process** is a series of software development activities that a software program goes through when developed

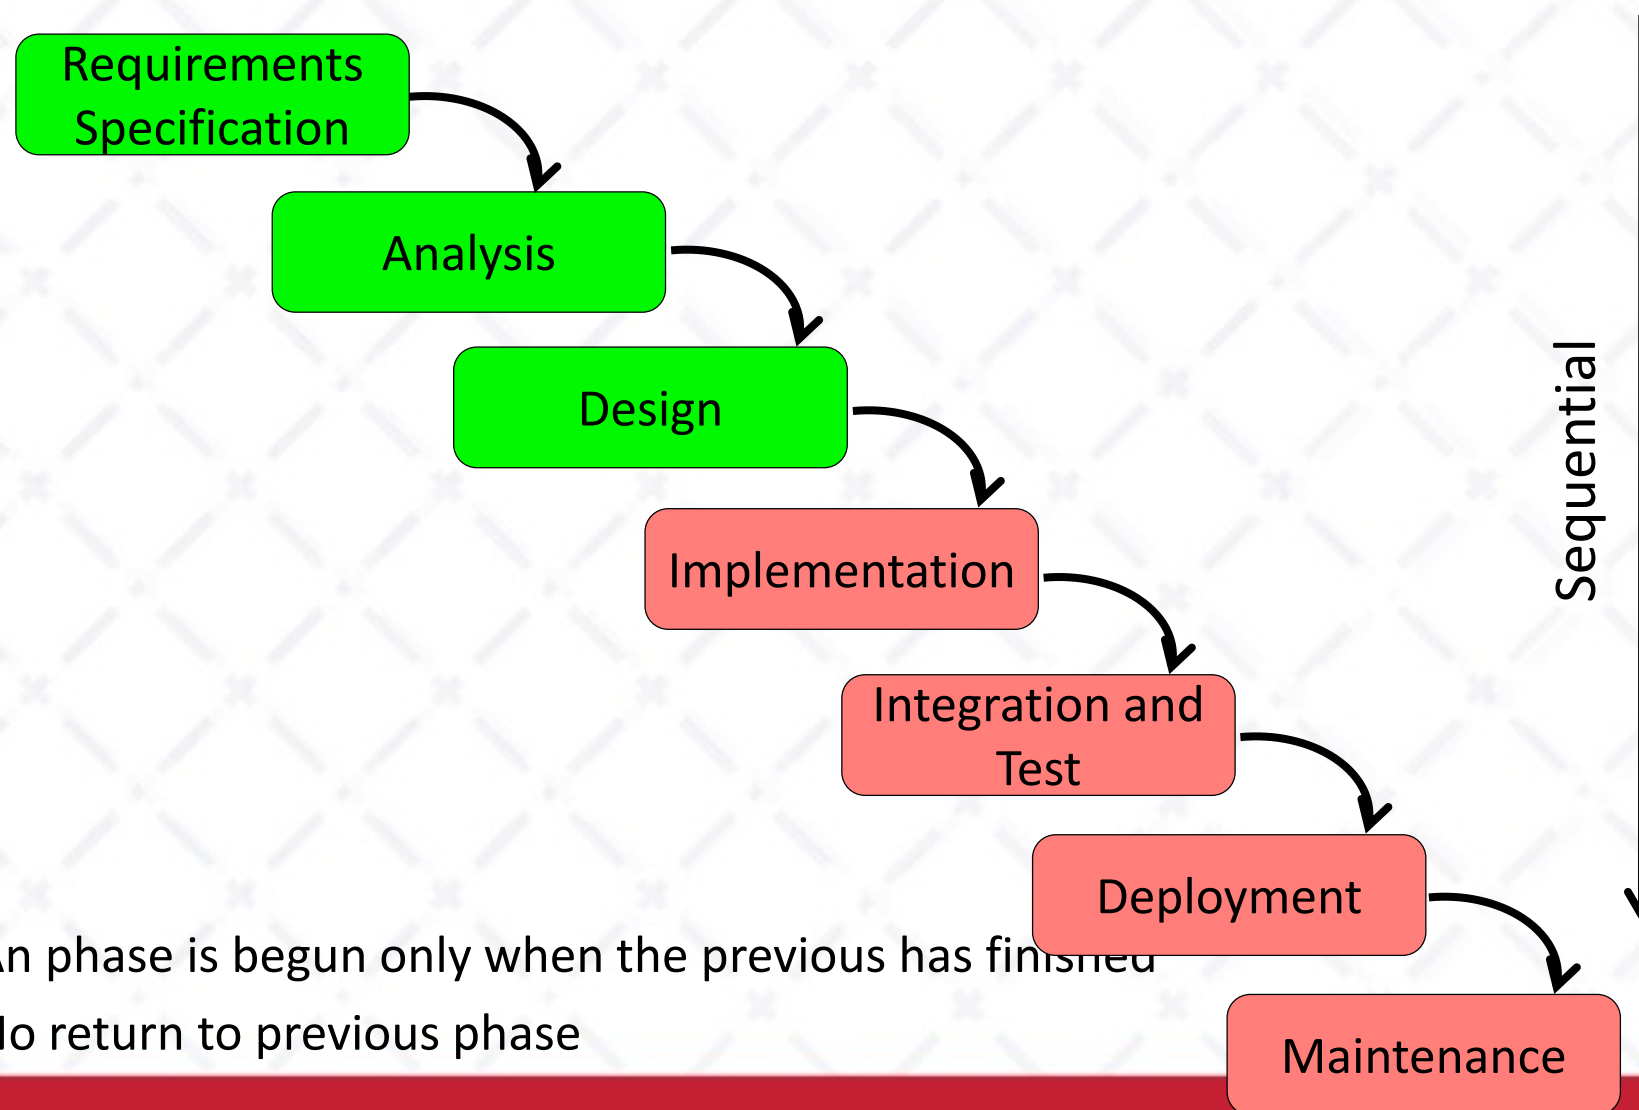

## Ad-hoc Coding “process”

- Does not scale to large size project
- Does not scale to large development teams

# Waterfall process

## Critique of Waterfall process

- Responds poorly to changes and problems
- Substantial upfront document
- Assumes fixed specification - may not be what customer wants
- Fixes come very late - costlier to fix later time

# Iterative and Agile Development Processes

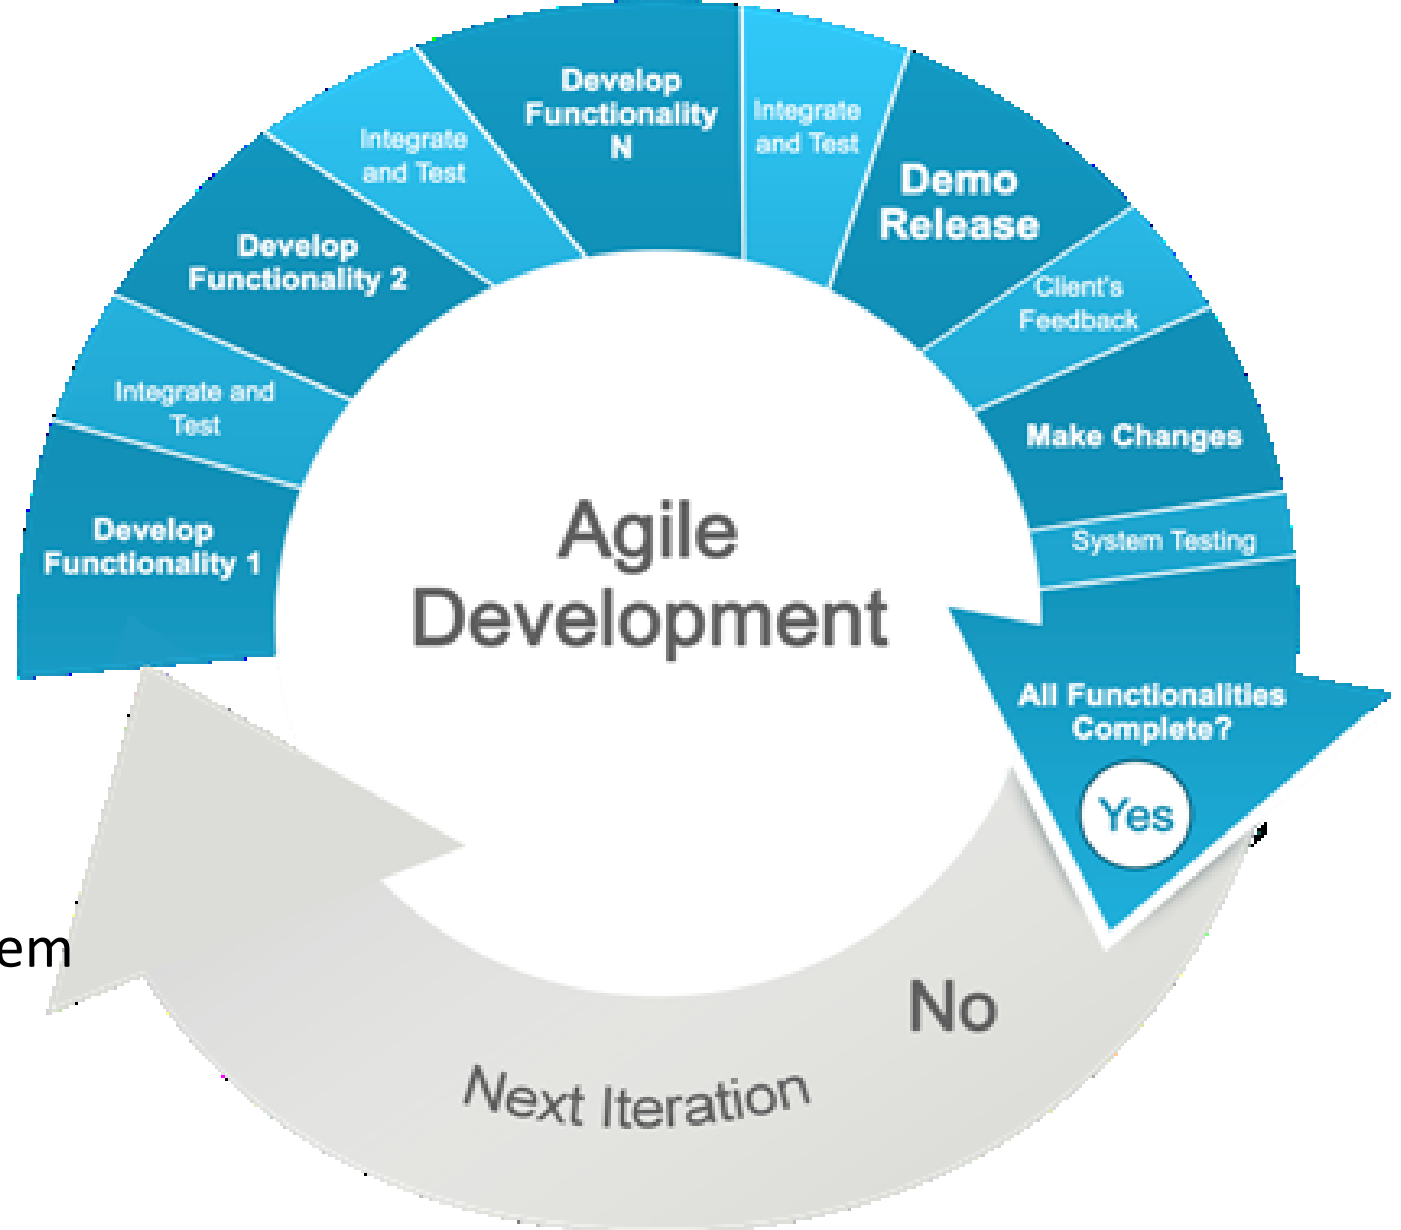

### Facts of life

- Requirements change, changes break existing design.
- Coding up a design suggests flaws in design
- Testing identifies flaws in code - which could be design flaws
- Maintenance requires not only fixes but new features

# Philosophy

- Embrace change
- Don't do too much, too soon
- Individuals and interactions over processes and tools
- Working software over comprehensive documentation
- Customer collaboration over contract negotiation
- Responding to change over following a plan

Early coding, early testing of partial system in repeating cycles.  
Development begins before all requirements are defined in detail.  
Feedback is used to clarify evolving specification.

## Benefits

Less project failure, better productivity,  
and lower defect rates

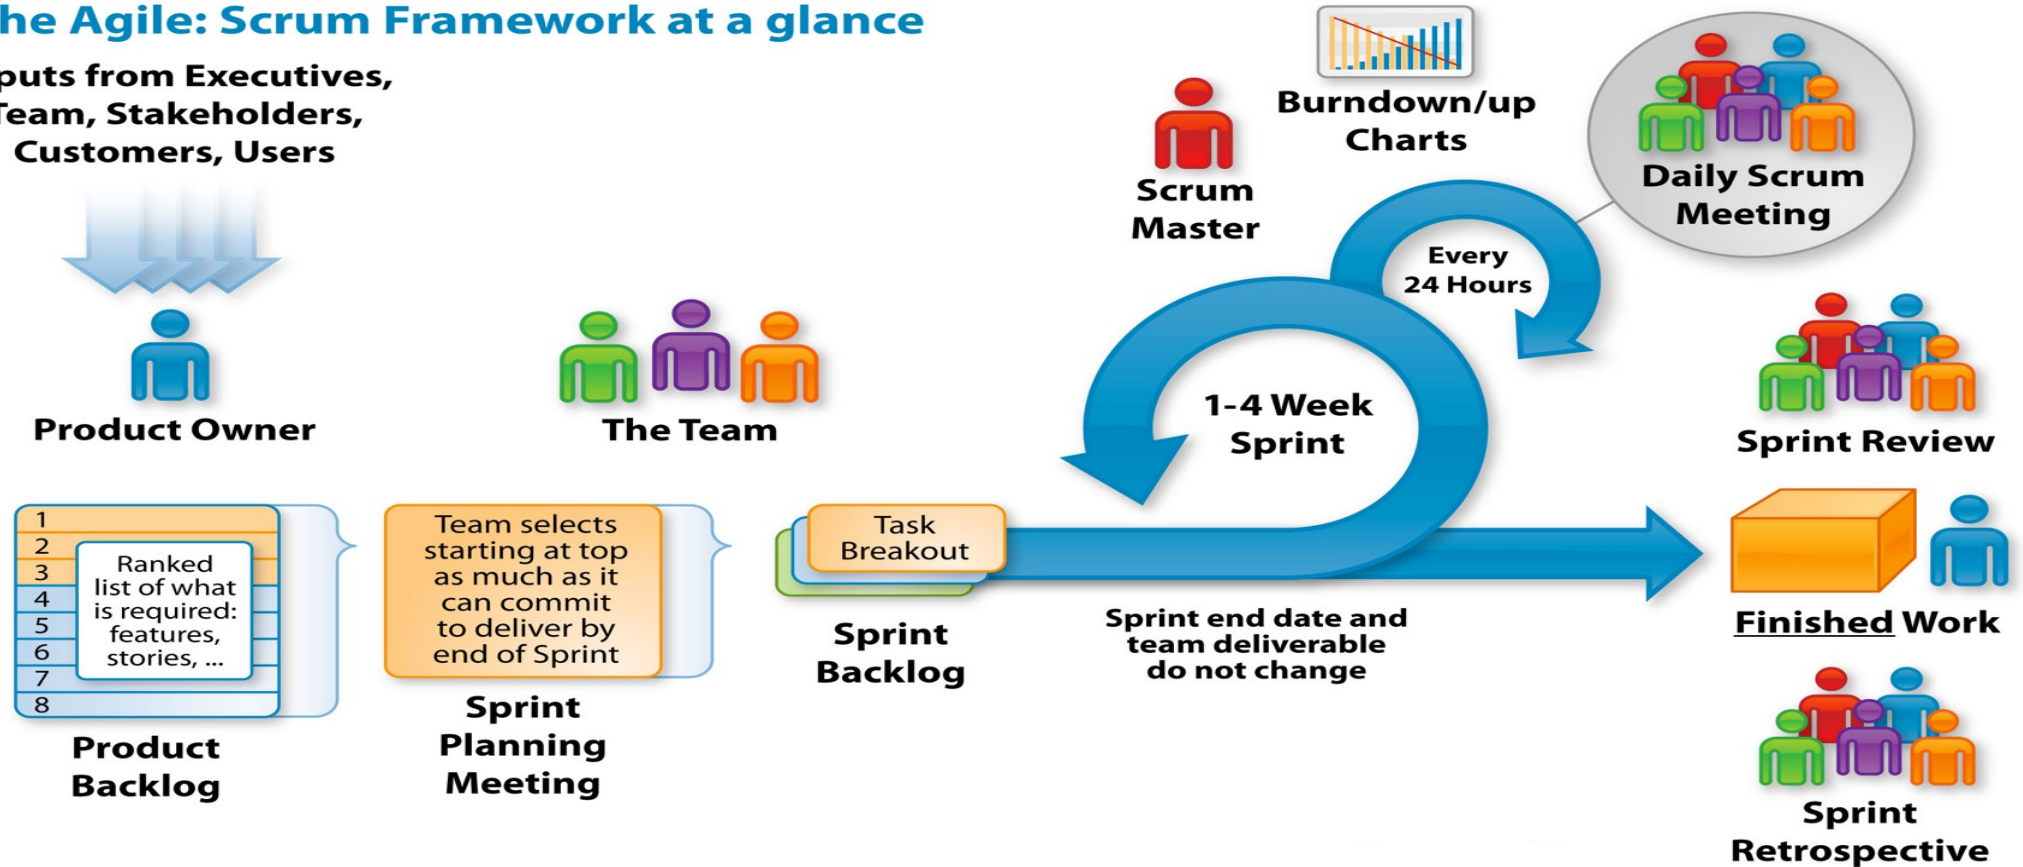

## Agile software development methods

- Adaptive software development (ASD)
- Agile modeling
- Agile Unified Process (AUP)
- Crystal Clear Methods
- Disciplined agile delivery
- Dynamic Systems development method (DSDM)
- Extreme programming
- Feature-driven development (FDD)
- Lean software development
- Kanban
- Scrum
